1. The applicant is hereby notified that International Preliminary Examining Authority transmits here with the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.
4. **REMINDER**
The applicant must enter the national phase before each elected office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details in the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

2. Citations and explanations (Rule 70.7)

Reference is made to the following documents:

D1: US 5790089 A

D2: US 6232939 A

The present invention relates to a liquid crystal display and a driving method thereof.

D1 discloses a method for driving an active matrix type liquid crystal display device. As shown in FIG. 18 of D1, the picture element at an intersecting portion is supplied with a different signal for each selection period within a black display period, whereby the liquid crystal panel is displayed black. The difference to the claimed invention is that in D1, the liquid crystal panel has the structure of a set of liquid crystal layers and two-terminal active layers are connected in a series between a set of column electrodes and a set of row electrodes.

In Claims 1, 3, 8, 11 and 13 of the present invention, the data signals include normal data signals and a black data signal. However, different from D1, the data driver alternately applies the normal data signals and the black data signal to the pixels under control of the signal controller, and the scanning direction of the normal data signals is opposite in adjacent frames.

Therefore, the invention, as in Claims 1-14, is considered to be novel and to involve an inventive step.
